**I'm not robot!**

I'm not robot!

Are you looking for an official way for data transfer of files from Samsung devices? Are there any Samsung transfer tools in the form of an app that will help you transfer data in a single click? Why not? Smart Switch from Samsung is one of the apps that will fulfill your expectations. It can now be downloaded from Google apps and is entirely compatible with any Android device. In Smart Switch, you can transfer data between Galaxy devices in one click, and more importantly, you can transfer personal data like contacts, messages, alarms, and history. Features of Smart Switch Facilitates fast connection and data transfer process. Data restoration and data Backup are easy with simple steps. With Smart Switch, you can synchronize your contacts and other data in the form of iCal and Windows Outlook. Fully compatible with all types of Android devices, including Blueberry, Galaxy Smartphones, Panasonic, OPPO, Vivo, etc. Cons: A: Though Samsung Smart Switch is a good choice to carry out the Samsung Data Transfer process, it is limited. You cannot transfer your data from a Samsung device to other brand phones. That is, only other devices to Samsung data transfer is possible. The reverse is not allowed. B: If the file is large, Smart Switch takes a lot of time to complete the task. It's something we all fear: losing our precious files when we get a new phone or device. Luckily, the Smart Switch app makes it easy to transfer content from your Android phone to another phone. You can even create a backup on a computer that you can use later in case of an emergency, like if you break your phone. You can transfer many different types of files using Smart Switch. However, some can only be transferred between two Galaxy phones. Personal content: Contacts, S Planner, Messages, Memo, Call logs, Clock, and Internet. App data: Images, Music (DRM free content only), Videos (DRM free content only), Documents, Story Album, and Applications. Settings, etc: Email, Wallpaper, Lock screen, Radio, and Preferences. A wireless transfer is usually most people's preferred way to copy data to a new phone because it's fast and lets you keep the phones plugged into their chargers during the transfer. First, make sure the Smart Switch app is installed on both phones, and plug them into their chargers. When you're ready, place the phones within 4 inches of each other. Launch Smart Switch on both phones. Tap Send data on the old phone, tap Receive data on the new phone, and then tap Wireless on both phones. On your new phone, select the type of your old phone (Galaxy, iPhone, etc.). Follow any on-screen instructions; some devices may have additional steps. Next, complete the connection by tapping Allow on the old phone. On your new phone, choose the content you want to move, and then tap Transfer. Once the transfer is complete, tap Done on the new phone, and then tap Close on the old phone. Now you're good to go. If you don't want to transfer your files right now but would like to create a backup that you can use later, you can make one using Smart Switch and a computer. First, make sure Smart Switch is installed on both your phone and computer. Connect your phone to your computer using a USB cable, and then tap Allow on your phone. Next, navigate to and open Smart Switch on your computer, and then click Backup. Your computer will automatically start backing up your phone's data, which may take several minutes. When it's done, a screen will appear informing you it's complete. Click OK. When you back up your old phone's content on a PC or Mac, the files are automatically stored in a default location (unless you've chosen a different location). Here are the default locations, so you'll know where everything is stored: Windows 8, Windows 7, Windows Vista: C:\Users\[username]\AppData\Roaming\Samsung\Smart Switch PC Windows 10: C:\Users\[username]\Documents\Samsung\SmartSwitch Mac OS X: /Users/[username]/Documents/Samsung/SmartSwitch/backup To quickly access the AppData folder on a PC, click Start. In the search bar, type appdata and press the Enter key. Here's another way to get content from your computer onto a new Galaxy phone - you can synchronize data on your phone with your computer. Syncing ensures you have the same content on your PC or Mac and your phone. On a PC, open Smart Switch, and then click Outlook Sync. If you are not already logged into your account, sign in with your Microsoft Outlook credentials. Next, click Sync Preferences for Outlook, select what you want to sync, and then click OK. Click Sync Now, and then click Confirm when finished. On a Mac, open Smart Switch, and then click Sync. Choose specific content to sync from your computer, and then click Sync Now. When syncing is complete, click Confirm. Thank you for your feedback! © 2022 Samsung Electronics America, Inc. Samsung, Samsung Galaxy and Family Hub are trademarks of Samsung Electronics Co., Ltd. All other brands, products and services, and their respective trademarks, names and logos, are the property of their respective owners. The above content is provided for entertainment and information purposes only. Consult user manual for more complete information. All information included herein is subject to change without notice. Samsung is not responsible for any direct or indirect damages, arising from or related to use or reliance of the content herein. You can drag and drop up to 100 files at a time, of any type. However, moving entire folders is not supported, and no single file can be larger than 512MB. The size of content will be adjusted to 1MB if "metered data" is used. For text files, the size will be limited to 128KB or less, and images will be resized to 1MB or less. by Anna Sherry Updated on 2022-01-10 / Update for TransferTransferring files between different devices is a repetitive task for most modern users. You see, there could be several reasons why you would want to do that. You could be trying to save some storage space on your phone by moving your important stuff to your PC. You could be backing up your important documents to your PC's hard drive from your phone. There are endless reasons for doing it. However, if you're not that familiar with the Android and Windows ecosystem, you might find Android file transfer Windows quite confusing. But don't worry — this article has got you covered. The most obvious way to go about the situation is to transfer files from Android to PC using USB cable. However, depending on the type of computer you have, there could be certain use cases and disadvantages to this method. Situation 1: Transfer Files from Android to Windows To transfer photos from Android to PC with a USB cable— or any other type of data for that matter, follow the steps. Connect your Android phone to the Windows PC. From your phone's notification panel, select the "Charging via USB" notification then select "File Transfer Protocol". Open "This PC" on your computer and look for your device's name in the Local Drives section. Copy the files or folders you want to transfer to your PC, then paste them into your computer's hard drive. There are a few disadvantages to using this method. First, the files and folders are presented to you in a pretty complicated manner. You have to go through the dozens of folders in your Android device's storage to find the things you're looking to transfer. Furthermore, if you don't have any experience with Windows drivers, you may even not be able to connect your phone to the computer. Situation 2: Transfer Files from Android to Mac If you're using a Mac, here are the steps to transfer files from phone to PC with a USB cable. Download and install Android File Transfer on your Mac. Connect your phone to the Mac using a USB cable, then select "File Transfer Protocol" from the notification on your Android device. Open Finder on the Mac and navigate to Android File Transfer. Select the files you want to transfer, then copy and paste them to your Mac. The downside to this method is that you have to go through Android's complex file system to find the files and folders you want to transfer. Furthermore, the fact that you have to download the Android File Transfer utility is a bummer, too. To transfer files from phone to PC wireless, you can use a cloud storage service like Google Drive, Dropbox, and OneDrive. In this article, we take the example of Google Drive to demonstrate the method. Set up Google Drive on your Android device; make sure you're logged into the correct Google Account. Open Google Drive and select the "+" button at the bottom. Select to upload new files, then find and select the documents, photos, and videos you want to upload. Wait for the upload to complete. Open Google Drive on your PC's browser, and sign in to your Google Account. Select the files you have just uploaded, and tap "Download" to download them to your PC. There's a clear disadvantage to using this method. You have to wait for the files to be uploaded to the cloud, then wait for them while they're downloading to your PC. It's a big problem if you have a slow or limited data connection. Another method to transfer files from Android to PC wireless is through email. To do that, follow the steps. Open your mail app of choice, Gmail for instance. Compose a new email and enter your own email address in the "To" section. Select to attach files with the email, then find and upload the stuff you want to transfer. Tap the Send button and wait for the files to be uploaded and sent. Open Gmail on your PC's browser, then select the mail you just received from yourself. Download the files attached to the email. Just like the previous method, this one has a clear disadvantage. You need to wait for the files to be uploaded to the cloud and then downloaded to your PC. The attachments size is limited. You can also use Bluetooth to transfer pictures from Android to PC. To do that, follow the steps. Turn on Bluetooth on your PC by searching for it in the Windows search bar. Turn on Bluetooth on your Android using the toggle in the notification panel. Then find the your computer and to pair. You also need to click "Pair" or "Connect" on your computer. You might need to enter the code to pair. Then in your computer's Bluetooth settings, click "Send or receive files" and then click "receive files. On your Android phone, choose the file that you need to transfer and tap on "Share" button. Select Bluetooth. Choose your Windows PC's name from the list of available devices. Wait for the transfer to complete. This method has a clear disadvantage. Transferring files through Bluetooth could be very slow. Depending on the size and number of photos you're sending, you might have to wait for hours. You can also use a file transfer from mobile to PC tool to do this task. Here are a few infamous options. 1. Droid Transfer Droid Transfer is a Windows application you can use to transfer files from Android to PC WiFi. It lets you transfer different kinds of media, documents, and files from your smartphone to the PC. However, the downside is that: You will have to download a companion app on your Android device, too. For most users, downloading new pieces of software on both devices could feel quite tedious. 2. Xender Another popular tool to transfer files from Android to PC is Xender. With Xender, you can transfer various kinds of files like photos, videos, documents, and more. However, to use Xender: You have to build a connection between the two devices. To do that, you will have to download the Xender app on your phone, visit Xender's website on your PC, and then scan the QR code with your phone's camera. For novice users, this might be a lot of work. If you have an iPhone and want to transfer files from it to your PC or Mac, Tenorshare iCareFone has got you covered. iCareFone is the single best tool to transfer almost all sorts of important data from your iPhone to your computer with ease. Furthermore, you can also transfer all of your iPhone's photos to your computer with a single click. It is compatible with the latest iOS system and iPhone models such as iPhone 13. To do that, follow the steps. Download and install iCareFone on your PC or Mac. Connect your iPhone to the computer and open iCareFone. On the main interface of iCareFone, select "One-Click to Export Photos to PC" Wait for the process to complete. When it's done, your photos have been successfully exported from the iPhone to the computer. And if you want to transfer more files from your iPhone, you can click Manage from the top menu and export these files to your computer. Here's the video guide: Transferring files from phone to computer is a common task that we do quite often. This article talks about the top 5 methods you can use to transfer files from Android to PC. If you have an iPhone, iCareFone is the best-ever tool you can use to transfer or backup your important data to a computer.
